

CSE220: Data Structures
Spring 2025
Theory QUIZ-02
Duration: 35 Minutes

Name :	ID:	Section:
--------	-----	----------

1. Find the Saddle Point: A saddle point in a 2D array is an element which is the smallest element in its row and the largest element in its column. Write a function to find a saddle point in a given 2D array

Sample Input	Sample Output
[[7, 18, 5], [8, 13, 19], [9, 13, 14]]	9

2. Sort a Stack Given a stack of integers, write a function to sort the stack in ascending order without using any other data structure (other than the stack itself).

Sample Input	Sample Output
[3, 1, 4, 2]	[1, 2, 3, 4]

3. Reversing First K Elements of Queue: Given a queue of integers, reverse the first k elements of the queue. Do not modify the order of the remaining elements in the queue.

Sample Input	Sample Output
[1, 2, 3, 4, 5], k = 3	[3, 2, 1, 4, 5]
